1- Automatic Fogging System

An automatic Fogging System can optionally be added to the Hycanx Disinfection Gate to offer a fast and economical solution for human disinfection in public areas such as workplaces, factories, supermarkets, restaurants, shopping malls and institutions. When a person enters the disinfection/sanitizing gate, the fogging system is automatically activated by sensor detection. With fogging method, the disinfectant liquid coming from the nozzles turns into a fog cloud and it reaches all microorganisms all over the body where the fog touches, and neutralizes the virus and bacteria without making wetness on the individual.

The movements of the passing person are detected with motion sensors, therefore, only specific nozzles will be activated to prevent disinfection liquid waste (zero waste sanitizer).

The system is lightweight, easy to install and ergonomically designed. Maximum hygiene is ensured by disinfecting the entire body surface.
